Props :- Refer to properties that a parent component can pass to its child component its is used for communication b/w components.

- can also be refered as attribute of an component or parameters of a function.
- we can use interface in (tsx) type script to use props sometimes.

- we use props also to make code generic & remove hard code.

Eg -
```
function MyHeader ( props ) {
    return <h1> { props.title } </h1>;
// curly brakes as it is dynamic value
}
```

// some name must be rendered

```
< MyHeader title = " This is my Heading " />
```

// like attribute

Module Package Library plugin

Inspect

→ Element Selector

→ Responsive check

↳ Element used to check changes in HTML & code

↳ Styles for CSS

↳ Console for all request / response & runtime JS errors

↳ Source have compressed Resources - images etc

↳ Network shows requests → Response

↳ performance → test website performance → SEO etc

↳ Memory → browser cache data

↳ Application → cache, storage, session,

↳ Security → shows if HTTPS, SSL certificate etc

↳ Lighthouse → test performance, SEO, ~~PWA~~ PWA App

VSC

- Pascal Case / Upper Camel Case - React Component
  Component files
  CSS
  import - match file name

- Camel case - Non-Component files - utility, hooks, config files

- lower letter - for html tags
